Milestone 2

Creation of Import Set Table and Transform Map (ServiceNow)

Objective: Load data from an Excel/CSV file into a ServiceNow staging (import set) table, then map it to the target table using a Transform Map.

Task 1: Create Import Set Table

An Import Set table is a temporary staging table that holds the raw data from the source file before it is transformed into the target table.

Method: Load Data (Excel / CSV)

1. Log in to your ServiceNow instance as **admin**.
2. In the Filter Navigator, search **System Import Sets > Load Data**.
3. Under **Import set table**, select **Create table**.
4. Enter the **Label** (e.g., *Import Users Data*). The Name auto-fills with the prefix **u_** (e.g., *u_import_users_data*).
5. Set **Source of the import** to **File**, and **Type of data** to **Excel (.xlsx)** or **CSV**.
6. Click **Choose File** and upload your file. Confirm **Header row** = 1.
7. Click **Submit**. The data is loaded into the new import set table.
8. Click **Loaded data** (or open the import set table) to verify that all rows and columns are loaded correctly.

Details to note

Field	Example Value
Label	Import Users Data
Name	u_import_users_data
Extends table	Import Set Row (sys_import_set_row)
Source	Uploaded Excel / CSV file

Task 2: Create Transform Map

A Transform Map defines how each field in the import set (source) table maps to the field in the target table.

Steps

1. Navigate to **System Import Sets > Administration > Transform Maps** (or use the **Create Transform Map** link after loading data).
2. Click **New**.
3. Fill in the form: **Name** (e.g., *Import Users Transform Map*), **Source table** = your import set table (u_import_users_data), **Target table** = the required table (e.g., *sys_user*).
4. Tick **Run business rules** if required, then click **Save** / **Submit**.
5. Scroll to the **Field Maps** related list and click **Mapping Assist** (or **New**).
6. Map each **Source field** to the matching **Target field** (e.g., u_first_name → first_name). Click **Save**.
7. Optionally use **Coalesce** on a unique field (e.g., email) to avoid duplicate records.
8. Go to **System Import Sets > Load Data** results, click **Run Transform**, choose the transform map, and click **Transform**.
9. Verify the records in the target table and check the **Transform History** for inserted / updated / error counts.

Sample Field Mapping

Source Field (Import Set)	Target Field (sys_user)
u_first_name	first_name
u_last_name	last_name
u_email	email
u_department	department

Verification Checklist

Check	Status
Import set table created with correct columns	■
Data loaded successfully (row count matches file)	■
Transform map created with correct source and target tables	■
All field maps added	■
Transform run without errors; records visible in target table	■

Note: Replace the example names and fields above with the ones from your project.
