Milestone 3

Transform Data, Validate and Enable Coalesce (ServiceNow)

Objective: Run the transform map to move data from the import set table to the target table, validate the result, enable coalesce so duplicate records are not created, and test by inserting new data in Excel format.

Task 1: Transform Data and Validate

Steps

1. Navigate to **System Import Sets > Load Data** and load your Excel file into the import set table (or open the existing import set from **System Import Sets > Import Sets**).
2. After loading, click **Loaded data** and confirm the rows are present.
3. Go back to the import set record and click **Run Transform** (or use the **Transform** related link).
4. Select the **Transform Map** created in Milestone 2 and click **Transform**.
5. Wait for the transform to complete. A **Transform History** page appears showing the result.
6. Check the counts: **Inserted**, **Updated**, **Ignored**, **Skipped** and **Error**.
7. Open the **Transform Errors** / **Import Log** (System Import Sets > Import Log) to review any failed rows.
8. Open the **target table** (e.g., sys_user list) and verify that the records and field values match the Excel data.

Validation Checklist

Check	Expected Result
Row count in import set table	Equals number of rows in Excel file
Inserted count in Transform History	Equals number of new records
Error count	0 (or errors explained and fixed)
Target table field values	Match the source Excel data

Task 2: Enable Coalesce to Avoid Duplicate Records

Coalesce checks whether a record with the same value in the coalesce field already exists in the target table. If it exists, the record is **updated**; if not, a new record is **inserted**. This prevents duplicate records.

Steps

1. Navigate to **System Import Sets > Administration > Transform Maps** and open your transform map.
2. In the **Field Maps** related list, open the field map of the unique field (e.g., **u_email** → **email** or **u_employee_id** → **user_name**).
3. Tick the **Coalesce** checkbox.
4. Click **Update** / **Save**.
5. Confirm that the Coalesce column shows **true** for that field in the Field Maps list.
6. (Optional) If more than one field is coalesced, a record matches only when **all** coalesce fields match.

Tips

• Choose a field that is truly unique (email, employee ID, user name, number).
• Empty coalesce values can cause the record to be inserted as new, so keep the coalesce column filled in Excel.
• Coalesce is case-sensitive unless **Case sensitive** handling is configured, so keep the data format consistent.

Task 3: Inserting New Data in Excel Format

This step tests the coalesce setting by loading a new Excel file that contains both existing and new records.

Steps

1. Open the original Excel file and **add new rows** with new data (unique coalesce values). Keep the same column headers.
2. (Optional) Also keep one or two existing rows, changing another field (e.g., department) to test the update behavior.
3. Save the file in **.xlsx** format.
4. Go to **System Import Sets > Load Data**. Under **Import set table**, select **Use existing table** and choose your import set table (do **not** create a new one).
5. Upload the updated Excel file, set **Header row** = 1 and click **Submit**.
6. Click **Run Transform**, select the same transform map and click **Transform**.
7. Check **Transform History**: new rows should show as **Inserted**, existing rows as **Updated**, and no duplicates should be created.
8. Open the target table and verify the new records are added and existing records are not duplicated.

Expected Result

Scenario	Result
Row with a new coalesce value	Inserted as a new record
Row with an existing coalesce value	Existing record updated (no duplicate)
Row with an invalid or missing value	Reported in error / import log

Final Checklist

Check	Status
Transform executed and history reviewed	■
Target table data validated	■
Coalesce enabled on the unique field	■
New Excel data loaded into the same import set table	■
No duplicate records in target table	■

Note: Replace the example field and table names with the ones from your project.
