# MILESTONE 1

# Creation of Spreadsheet and Table

## 1. Creation of Spreadsheet

A spreadsheet is a digital worksheet used to organize, store, calculate and manage data in rows and columns. For this milestone, the required data is first collected and entered into a spreadsheet. Each column should have a clear heading and each row should represent one record.

## Steps for Creating a Spreadsheet

| Step | Activity |
|---|---|
| 1 | Open Microsoft Excel or another spreadsheet application. |
| 2 | Create a new blank workbook. |
| 3 | Enter suitable column headings. |
| 4 | Enter the required records row by row. |
| 5 | Check the data for missing or incorrect values. |
| 6 | Format the headings and adjust column widths. |
| 7 | Save the spreadsheet with an appropriate file name. |

## 2. Creation of Tables

A table is a structured collection of related data arranged in rows and columns. After preparing the spreadsheet data, the data can be organized as tables so that it can be easily imported, searched, updated and managed.

## Steps for Creating Tables

| Step | Activity |
|---|---|
| 1 | Identify the data required for the table. |
| 2 | Define the table name. |
| 3 | Define the column names and data types. |
| 4 | Enter the records into the corresponding columns. |
| 5 | Check for duplicate, missing or invalid values. |
| 6 | Save and verify the completed table. |

## Milestone 1 Flow Diagram

| |
|---|
| **Data Requirements** |
| ↓ |
| **Create Spreadsheet** |

| |
|---|
| **Enter Column Headings** |
| ↓ |
| **Enter Records** |
| ↓ |
| **Validate Data** |
| ↓ |
| **Create / Organize Tables** |
| ↓ |
| **Save and Verify** |

## Expected Output

At the end of Milestone 1, a properly formatted spreadsheet containing the required records and the corresponding structured table(s) should be available. The data should be accurate, consistent and ready for the next stage of the project, such as importing the spreadsheet data using a Transform Map.
